No conflict of interest to declare

History

The first abdominal operation in the Western World was performed by the Kentucky physician, Ephraim McDowell (1771-1830) on a woman with a large ovarian tumour.

Dr. Ephraim McDowell

The first successful use of chemotherapy to eradicate a solid tumour (choriocarcinoma) Roy Hertz and Min Chiu Li at the NIH in the 1960s

Invasive
tumour

Metastatic
tumour

Basic statistics

Up to 10% of women will have some form of surgery during their lifetime for the presence of an ovarian mass.

A woman's lifetime risk of developing invasive ovarian cancer is 1 in 79.

A woman's lifetime risk of dying from invasive ovarian cancer is 1 in 109.

The median age at which women are diagnosed with ovarian cancer is 63

BEAT Ovarian Cancer

- Bloating that is persistent and doesn't come and go
- Eating less and feeling full more quickly
- Abdominal and pelvic pain you feel most days
- Then talk to your GP about your symptoms

C. VAN HOLSBEKE*, D. PALADINI¶, B. VAN CALSTER‡, I. VERGOTE*, S. VAN HUFFEL‡
and L. VALENTIN**

Rules for predicting a malignant tumor (M-rules)

- M1 Irregular solid tumor
- M2 Presence of ascites
- M3 At least four papillary structures
- M4 Irregular multilocular solid tumor with largest diameter ≥ 100 mm
- M5 Very strong blood flow (color score 4)

Rules for predicting a benign tumor (B-rules)

- B1 Unilocular
- B2 Presence of solid components where the largest solid component has a largest diameter < 7 mm
- B3 Presence of acoustic shadows
- B4 Smooth multilocular tumor with largest diameter < 100 mm
- B5 No blood flow (color score 1)

Background: Correct characterisation of ovarian tumours is critical to optimise patient care. The purpose of this study is to evaluate the diagnostic performance of the International Ovarian Tumour Analysis (IOTA) logistic regression model (LR2), ultrasound Simple Rules (SR), the Risk of Malignancy Index (RMI) and subjective assessment (SA) for preoperative characterisation of adnexal masses, when ultrasonography is performed by examiners with different background training and experience.

Methods: A 2-year prospective multicentre cross-sectional study. Thirty-five level II ultrasound examiners contributed in three UK hospitals. Transvaginal ultrasonography was performed using a standardised approach. The final outcome was the surgical findings and histological diagnosis. To characterise the adnexal masses, the six-variable prediction model (LR2) with a cutoff of 0.1, the RMI with cutoff of 200, ten SR (five rules for malignancy and five rules for benignity) and SA were applied. The area under the curves (AUCs) for performance of LR2 and RMI were calculated. Diagnostic performance measures for all models assessed were sensitivity, specificity, positive and negative likelihood ratios (LR+ and LR-), and the diagnostic odds ratio (DOR).

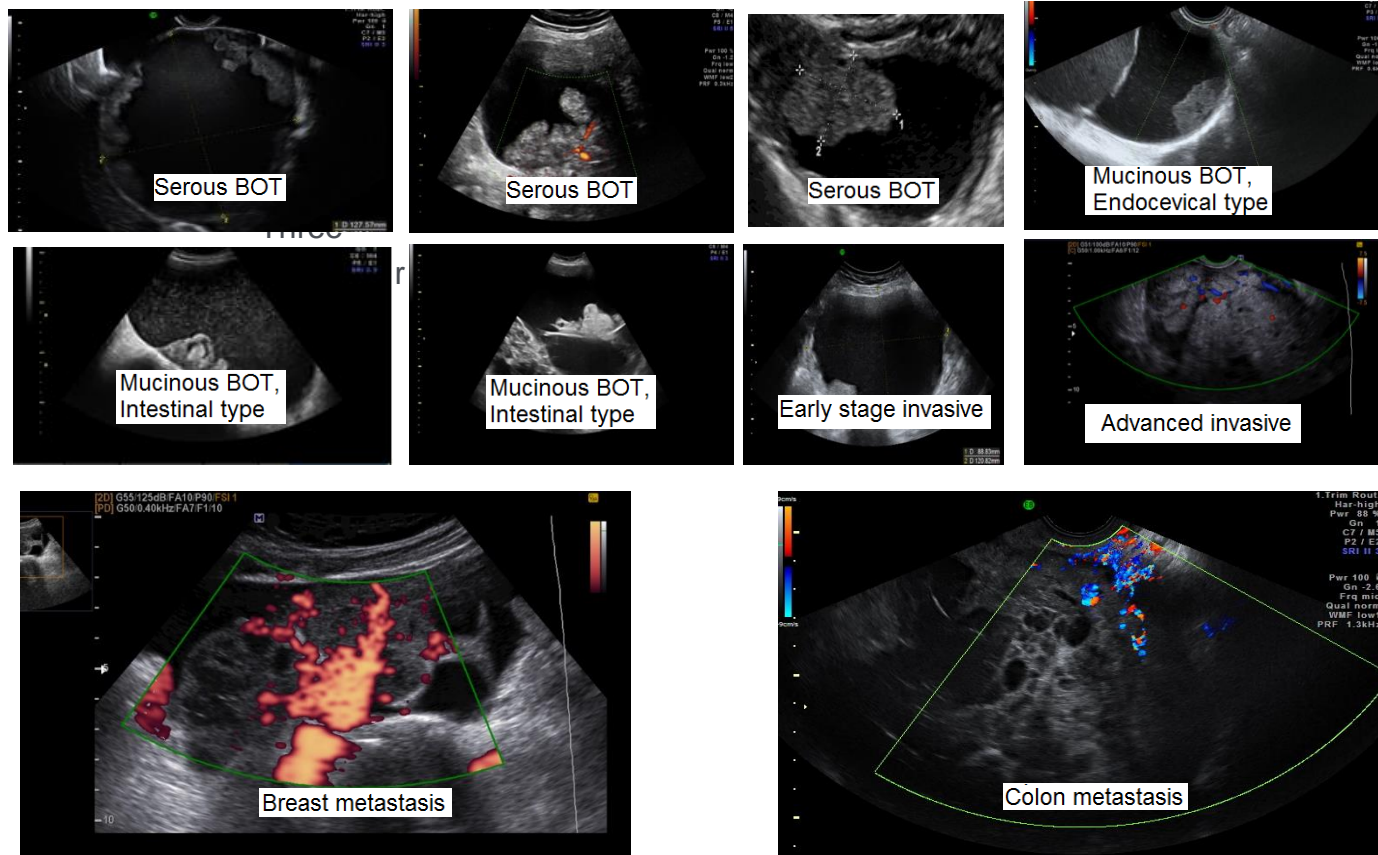

Results: Nine-hundred and sixty-two women with adnexal masses underwent transvaginal ultrasonography, whereas 255 had surgery. Prevalence of malignancy was 29% (49 primary invasive epithelial ovarian cancers, 18 borderline ovarian tumours, and 7 metastatic tumours). The AUCs for LR2 and RMI for all masses were 0.94 (95% confidence interval (CI): 0.89–0.97) and 0.90 (95% CI: 0.83–0.94), respectively. In premenopausal women, LR2 – RMI difference was 0.09 (95% CI: 0.03–0.15) compared with –0.02 (95% CI: –0.08 to 0.04) in postmenopausal women. For all masses, the DORs for LR2, RMI, SR + SA (using SA when SR inapplicable), SR + MA (assuming malignancy when SR inapplicable), and SA were 62 (95% CI: 27–142), 43 (95% CI: 19–97), 109 (95% CI: 44–274), 66 (95% CI: 27–158), and 70 (95% CI: 30–163), respectively.

Conclusion: Overall, the test performance of IOTA prediction models and rules as well as the RMI was maintained in examiners with varying levels of training and experience.

Pattern Recognition of Ovarian Masses

Is Ultrasound a Reliable and Reproducible Method for Assessing Adnexal Masses in Pregnancy? A Systematic Review

Jonathan E. Gaughran , Osama Najj, Mohammed Q. Al Sabbagh, Ahmad Sayasneh

October 2021

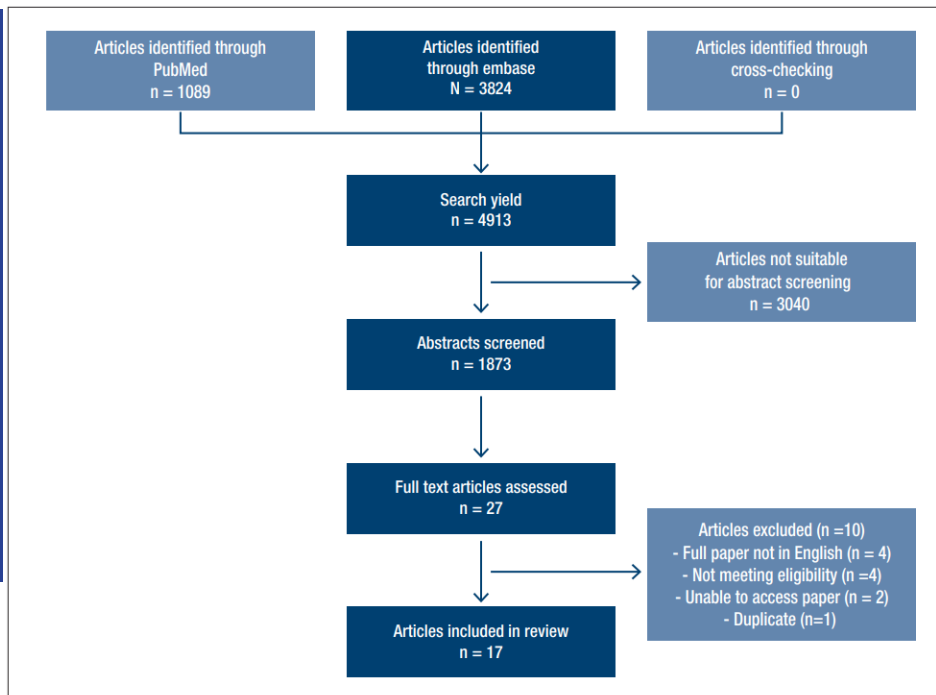

In conclusion, currently, there is a lack of high-quality prospective studies to guide the management of adnexal masses in pregnancy. Ultrasound appears to have an adequate accuracy in differentiating benign from malignant masses; however, more research is required to assess the role of ultrasound models, rules, and subjective assessment in pregnancy compared to non-pregnant women.

Can ultrasound reliably assess ovarian endometriomas in pregnancy? A systematic review

Jonathan Gaughran^{1*}, Osama Naji¹, Anas Murad², Ahmad Sayasneh^{3,4}

¹ Department of Women's Health, Guy's & St Thomas' NHS Foundation Trust; ² Faculty of Medicine, University of Jordan, Amman, Jordan; ³ Department of Surgical Oncology, Guy's and St Thomas' NHS Foundation Trust, Guy's Hospital, Great Maze Pond, SE1 9RT; ⁴ School of Life Course Sciences, Faculty of Life Sciences and Medicine, St Thomas' Campus, Westminster Bridge Road, London, SE1 7EH

Jan 2022

There is currently a lack of high-quality prospective studies to guide the clinician on how to diagnose and manage ovarian endometriomas in pregnancy. The accuracy of ultrasound in deciphering benign endometriomas from malignant masses appears to be less in pregnant than in non-pregnant women. Further work is required to assess the role of ultrasound models for assessing endometriomas in pregnancy.
